EDUCATION

Harvard University Cambridge, MA

Ph.D. in Neurobiology May 2026
Dissertation: Sensory Motor Circuit Computation in *Drosophila* Goal-directed Navigation

M.S. in Applied Math March 2024

Massachusetts Institute of Technology Cambridge, MA

B.S. in Brain and Cognitive Sciences May 2020
Honors & Awards: Hans Lukas Teuber Award for Outstanding Academics, Walle J.H. Nauta Award for Outstanding Research

SELECTED WORK EXPERIENCE

Scale AI, MLRE *May. 2026-present*

- Enterprise deep research agent benchmarking and post-training

Amazon, Research Intern *June. 2025-Dec. 2025*

- Created a novel benchmark for evaluating LLMs task performance considering both model capability and personalized preference alignment; in the application case of personalized recommendation, developed a process reward metric to balance both recommendation adoption and evidence faithfulness and leveraged it to perform RL post-training (accepted at **NYRL**)

Meta, Research Intern *May 2024-Aug. 2024*

- Developed a novel image-based feature representation tailored to high density sEMG and used customized CV models for gesture decoding and input feature attributions
- Introduced manifold capacity as a theoretical metric for representation quality evaluation and multimodal SSL loss
- Implemented generative models to extract disentangled factors in sEMG for generalization and data augmentation

Axoft, Data Science Intern *Sept. 2023-Dec. 2023*

- Developed and maintained in-house software pipelines for fluorescence imaging processing and spike sorting
- Applied statistical and machine learning models for neural decoding from population spiking and LFP data

Merck Research Laboratories, Research Intern June 2018-August 2018

- Performed cell culture, immunoprecipitation and high throughput fluorescence imaging and quantification to characterize TDP-43 protein interaction networks and pathology in Amyotrophic Lateral Sclerosis (ALS) model

Harvard University Cambridge, MA

PhD Researcher, Dept. of Neurobiology *Sept. 2020-May 2026*

- Discovered heterogeneous locomotion- and directional goal-related tuning in the Drosophila sensory learning center; demonstrated emergence via dopamine-driven plasticity of sensory panorama learning; showed coordination of downstream motor programs through regulation of a coupled ring attractor (selected talk at **Janelia Grounding Cognition in Mechanistic Insight Conference**; journal manuscript in prep)
- Pretrained text-to-image diffusion models on designed text-image corpora and used controlled attention localization, ablation, and circuit discovery to study mechanisms for generating object color, shape, and spatial relationships; identified a general solution for correct spatial-relation generation and how it varies with text encoding and model scale (**CVPR 2026 Highlight**)
- Developed a synthetic benchmark for user–assistant information bias across diverse LLMs; showed how different post-training recipes shape this bias, and demonstrated bidirectional control through synthetic fine-tuning on real conversations (**NeurIPS Multi-Turn Interactions 2025, ACL 2026**)
- Studied continual knowledge injection in autoregressive and diffusion LMs, including the impact of paraphrase augmentation; showed diffusion LMs are more data-efficient and avoid the reversal curse, and developed masked training that closes the performance gap for autoregressive LLMs (**COLM Context Beyond the Window 2026**, **TMLR** submission)

Master's Researcher, Dept. of Applied Mathematics *Sept. 2020 - March 2024*

- Developed an entropy-penalized composition method for multi-attribute reward models and demonstrated improved results on reward model benchmarks (**AAAI 2026**)
- Developed a framework to generate large-scale synthetic rule pool and perform data-aware rule selection for scoring preference data in the safety domain; Demonstrated improved results on reward model benchmarks using preference data scoring with the rule adaptor (**ICML 2025**)

- Developed an automated method to generate a large-scale, domain-specific dataset of graduate-level applied mathematics problems and benchmarked frontier LLMs on this dataset (**NeurIPS MATH-AI 2024, ICLR 2025)**
- Developed next-token preference (NTP), an unsupervised, annotation-free framework that trains reward models from raw math web text, improving reward-model evaluation and downstream best-of-N selection, GRPO, and supervised RM training (**ICLR SPOT 2026, NeurIPS 2026)**

SELECTED PUBLICATIONS AND TALKS

Hoy, W., **Fan, J.,** Celik, N., Pan, X. (2026). Continuous Context Management. Submission to **ICLR 2027.**

Hoy, W., **Fan, J.,** Celik, N., Pan, X. (2026). Asynchronous Is Nearly Free for Evolution Strategies on Long-Horizon Agentic Tasks. Accepted at **NeurIPS 2026 Pre-to-Post Workshop.** Submission to **ARR.**

Chatrath, V.*, Zhu, B.*, **Fan, J.***, Pu, G., Tiwari, S. D., Dan, S., Young, R., Li, Y., Yao, Y., Shanker, A., Yang, M., Zhang, D. Y., He, Y., Liu, Y., Wang, C., Yin, Z., Xue, Y. (2026). READY or Not: Reliable Enterprise Agent Deployment. Submission to **ICLR 2027.**
